Request for thesis study participants to test the effectiveness of a behaviour treatment for caregiver separation

Children between the age of 3-6 with Autism Spectrum Disorder (ASD), or dual diagnosis of ASD and Separation Anxiety Disorder (SAD) with an intellectual impairment

- Child must have difficulty separating from their caregiver for no longer than 1 minute in the home environment

- Study will take place in your home with a Board Certified Behaviour Analyst and doctoral student at The Chicago School of Professional Psychology

ABOUT THIS STUDY

Looking for children with ASD or a dual diagnosis of SAD and ASD, with an intellectual impairment. Child participants should be between the age of 3-6 who have difficulty separating from their caregiver in the home environment when the caregiver is out of sight for a period no longer than one minute. Each child participant must have the ability to request for a caregiver's presence and follow simple instructions with or without pictures as cues.

The study will take place in your home or through an online video conference with a Board Certified Behaviour Analyst and doctoral student at The Chicago School of Professional Psychology, to test the effectiveness of a behaviour treatment for caregiver separation. The anticipated time commitment for participation in this study is 30 minutes, three times per week, for a maximum of eight weeks, with an approximate 1-hour screening procedure and orientation prior. All sessions will be recorded.
